

## Embedding a Link into Your Wiki Page

Step 1: Have two windows or tabs open in Safari so you can have quick access to your Wiki page and the site you want to link at the same time.

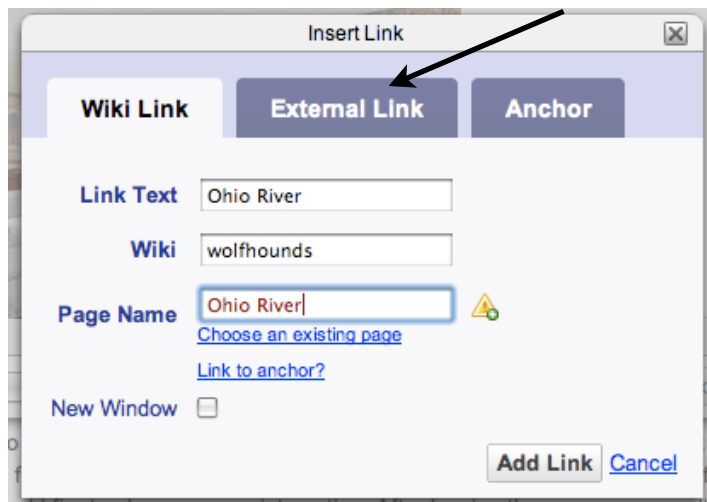

Step 2: Copy the link from the address bar of Safari by “copying it”. To do this highlight the address bar and go to “Edit: Copy”

Step 3: Go to your Wiki page, make sure you are in “edit” mode and select the words you want linked. In the example below, the words “Ohio River” are selected.

Step 4: Click on the link symbol on the editing bar. You will get a window that looks like this. You now need to click on the “External Link” tab.

Then you will get a window that looks like the one to the left below. Click in the Address Box and the go to “Edit: Paste”. This you put the link you copied earlier into the Address Box. The window will now look like the one below to the right.

Click on the “New Window” box and then the “Add Link” button.

Step 5: Check your work by hitting save on your “Editor Bar” and click on the words you just linked. If you did it correctly a new window will open up that has the page you wanted your reader to see.

Have fun!
